Attached please find two reports of pesticide sampling results from Anatek Laboratories. The first is the report from the original samples submitted to Anatek last fall. As you can see from the report, there was some damage to the samples during shipping, but the lab was able to recover much of the samples. The second report is for the two duplicate samples which were analyzed last week, and which were not damaged during shipping. The amounts found in the duplicate samples were significantly higher than those found in the originals, most likely reflecting the damage to the original samples.

Please also note that the quality assurance testing done by Anatek indicated a recovery rate of 5.6% for atrazine, 12% for desethyl atrazine (DEA) and 15% for hexazinone, suggesting that the amounts found in the POCIS represent only a portion of what was actually present in the water that passed through the POCIS.

We plan to release these results to the public in the near future.

Bobbi Lindberg, on behalf of Siuslaw Watershed Guardians
